

Do you know the Seasons cycle?

(winter, sprint, summer, fall)

We want to display the current season in some countries

When we tap on the card, the next season should be displayed

STEP 1 – Identify widgets you need for this app

Widget name Stateless or Stateful

(if stateful)

Widget	Type	Arguments	State

STEP 2 – Identify the type data for each UI element

Constant , Computed, State, Parameter

UI Elements property	Value source
SEASONS	
CAMBODIA	
Season image	

STEP 3 – Based on your strategy, code those components and test them

You can learn from the
correction of the Discount
Card exercise

```
@override
Widget build(BuildContext context) {
  return Scaffold(
    body: Padding(
      padding: EdgeInsets.all(8.0),
      child: Column(
        crossAxisAlignment: CrossAxisAlignment.stretch,
        children: [
          DiscountCard(initialPrice: 500, discountRate: 0.25),
          DiscountCard(initialPrice: 100, discountRate: 0.10),
        ],
      ),
    ),
  );
}
```
